

## Common Mugwort

<b>Genus/species</b>	<i>Artemisia vulgaris</i>
<b>Family</b>	Asteraceae
<b>Distribution</b>	<b>Eastern and Northwestern United States</b> Minnesota S to Missouri Missouri SE to Florida Florida N to Maine Maine W to Minnesota Introductions to Pacific NW and elsewhere

**Comments** This is a common introduced weed of roadsides and cultivated areas, and its range may be expanding. The leaves are usually dissected (somewhat resembling those of the cultivated chrysanthemum), of a lighter color underneath, and have a distinct sage scent. The rather nondescript flowers are borne along the stalks, which can get to be 3 or more feet in height. Most plants bloom in the late summer or autumn. However, the plants may form large colonies, spreading mainly by rhizomes.
